Overview

sensors - controllers - actuators - interface

HIQ

comfort

simplicity

security

safety

practical

flexibile

cost-effective

HIQ is a home automation system, including lights, blinds, heating and cooling; temperature monitoring, energy management, timetable, evant-based automation and alarm.

HIQ consists of both hardware and software. Devices are connected to each other with a common power supply and communication bus.

Although basically simple, expansion capabilities are virtually unlimited. System is configurable, programmable, and allow integration of multiple HIQ installations into a single functional unit.

HIQ can be used for a new project and renovation. Most of the work is done by a common electrician, no specialized expert is needed. Most of the configuration is done by end-user.
System design is very simple, there are no complicated compatibility or dependency rules.

HIQ is fully open to work with many other home devices, either by integrating them in the system (e.g. touchless buttons), or cooperate on the signal level (e.g. professional alarm).
Features
new concept with unique features

new house or renovation

smartphone for everything

temperature setting for each room

full system integration

HIQ

manual or automatic operation

unconstrained design

total user control

very simple to use

Multiple timetables

Set things running up to your schedule. To configure the timetable, select active hours, then select devices to be affected. You can manually override output at any time.

Advanced RGB control

RGB mode allows control of hue, saturation and brightness; instead of individual red, green and blue channels.

In white temperature mode, output goes between different kinds of white, from bright daylight to warm incandescent light.

Evo light function provides synchronization between light temperature and time of day. In the evening, lights will automatically reach the warmer tone.

Usage

what all this hardware is for

Device		Used for
LC-10-IQ light controller		halogen and LED downlighters, all kinds of general-purpose lights
		managed socket for floor lamp, table fan, hi-fi system, projector, and all kinds of appliances
LD-V4-IQ LED dimmer		LED stripes
LD-P4-IQ LD-D8-IQ universal dimmer		dimmable lights of all kinds
BC-5-IQ blinds controller		window blinds, shutters and jalousies
SC-4T-IQ scene controller		user-selectable arrangement of lights and blinds
SC-4S-IQ scene controller		
TH-1-IQ TH-2-IQ TH-3-IQ electronic thermostat		heating, cooling and fan control
FC-1-IQ fan-coil controller		
HC-IQ master controller		smartphone and PC connection, automation, timetable, alarm, energy and other functions

Expansion

out-of-the-box and project-based features

Basic configuration

230VAC

switches

IEX bus

appliance control	smart grid integration	supervision	audio/video integration	DIY devices
KNX bridge	LON bridge	X10 bridge	Zigbee bridge	building integration

interconnection between basic IQ systems

project-based features

out-of-the-box features

HIQ system offer many out-of-the-box functions. However, modern home automation is all about integration, and that is where the HIQ excels. HIQ is capable of connecting various devices into a functional system. Integration is project-based, each home is attuned to investor and building requirements.

Background
technical experience behind the product

Design
Cybrotech originate from industry control and automation, all devices are designed and build up to a much higher standards then usually expected in home automation.

Features
- hardware watch-dog
- transient supression
- short circuit tolerant outputs
- reverse polarity tolerant supply
- wide temperature range
Addressing
Devices are addressed automatically, not a single address is set by user.

Firmware
All devices are build to implement firmware upgrade, so the future for your investment is assured.

Responsive
From keypress to action, typical reaction time is 10 milliseconds.

CAN bus is a multi-master, deterministic bus which offer optimum between performance, network architecture and cost.

Power consumption
HIQ take a great care to use as little electricity as possible.

Autorange inputs always ensure a full scale motion.

No batteries
The whole system is operated from a single 24V power supply.

No hidden costs at any level - everything is simple and elegant (and beautiful, too).

Programming tools are free, everybody is welcome to give it a try. Only a basic programming skills are needed. Join our group and discover how fun and simple house automation can be.
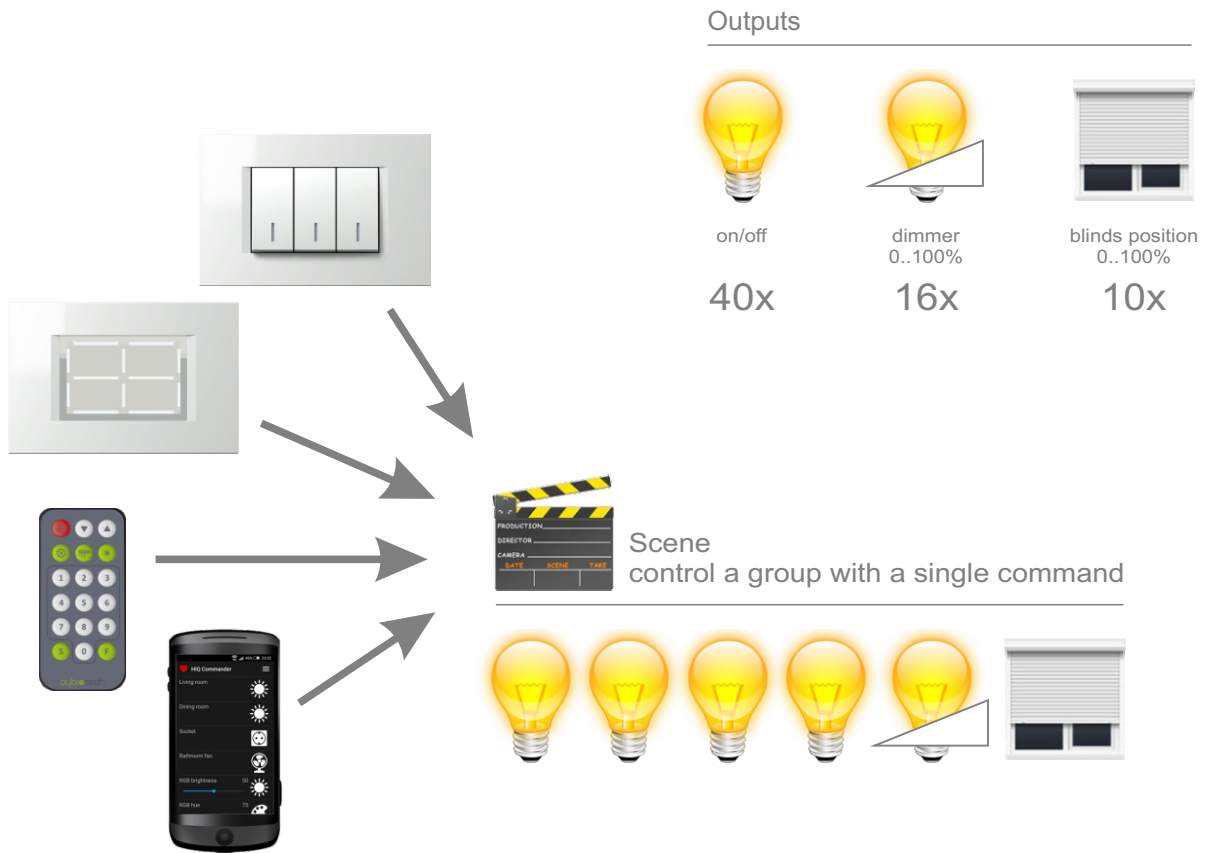

Wire vs. wireless
- no batteries
- more reliable
- faster response
- less EMI pollution
- simpler setup
- lower price

We don't sell switches, luminaries, computers, portable devices, tablets or phones; you have a freedom to select anything you like, buget models or expensive designer items. What we do sell is electronics, software and home automation experience at it's finest.

Lights and blinds

control everything from everywhere

Outputs

on/off	dimmer 0..100%	blinds position 0..100%

classic blinds

slatted blinds

Roman shades

managed socket for a floor lamp, table fan, dehumidifier, electric mosquito repellent, hi-fi system

blinds control with an intermediate position

RGB dimmer
hue, saturation and brightness

In RGB mode, dimmer channels are connected to red, green, blue and white lights. White channel is optional. Instead of individual channels, user controls total brightness, hue and saturation.

RGB dimmer may be used in white temperature mode. Here, user controls brightness and white temperature. White light is obtained by mixing all four channels. For best result, use white strip 2700K (warm white) and RGB strip 5600K (cool white).
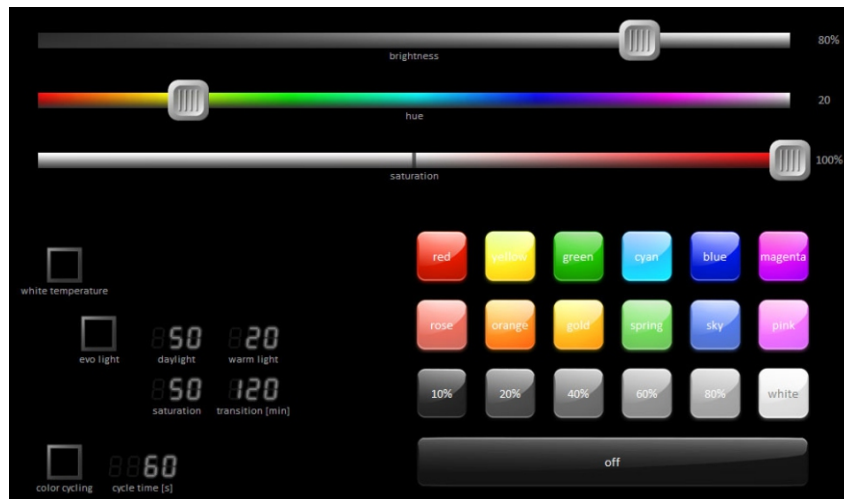

White temperature
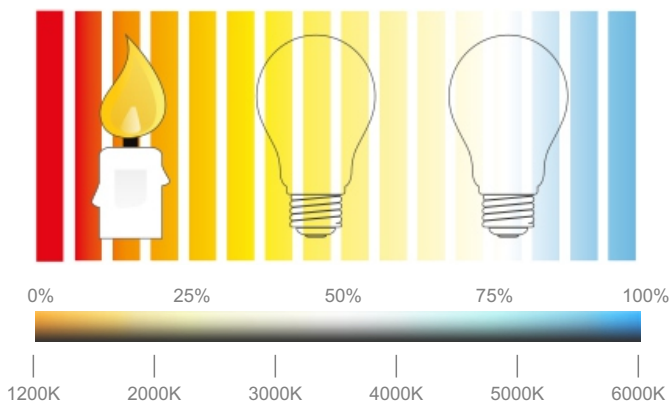

In RGB mode, saturation goes from white to selected color (0..100%). In white temperature mode, saturation goes from natural white (white strip) to selected white (0..100%).

Color cycling

Automatically rotate through the available colors. Brightness and saturation are selected manually.

Color picker

Color picker is a quick way to choose a color, available with the HIQ Commander application. To control the RGB, just touch a color or slide finger over the screen.

RGB mode   white temperature mode
# Scene

one touch to rule them all

Scene is user-defined memory including lights, dimmers and blinds. Each output is either defined by scene (on/off, lightness and position), or not affected.

inputs | timetable | automation | scene matrix

outputs

| on/off | dimmer | blinds |

Scene mapping

SC0 — 0, 1, 2, 3

not affected

Blinds action

blinds up
blinds 50%
blinds down
not affected

Hint: use scene 31 to turn all lights off.

Scene is initially created with HIQ Configurator. Once saved, it can be modified with a long press.

Automatic lights

where and how to use automatic lights

Benefits of automation depend mostly on how the space is used:

Legend:
- smart light
- ready light
- motion sensor
- door sensor
- manual control

Smart light is based on low light and presence signal, and it is used for a main living space. It can be combined with evo light to control light temperature during the evening.

Ready light take advantage of door and motion sensors. It is suitable for a space used occasionally, like a bathroom.

Motion sensor cover open spaces, hallway or porch.

Door sensor cover small rooms used temporary, like a closet, cloak or wardrobe.

Other areas, like a bedroom, are handled manually.

Simple automation

light automation based on a single sensor

usage	input mode	output mode	description
on/off			press on, press off
on/off + timer			press on, press off in case light is left on, timer turns it off
staircase			press on press again to reload the timer when timer expires, light goes off
doorbell			press on, release off
scene			press to set multiple lights preas again to turn the scene off
motion sensor			movement is keeping the light on when timer expires, light goes off
			movement is keeping the light on when timer expires, light goes off active only during the night
door sensor			open door to turn the light on close door to turn the light off
			open door to turn the light on close door to turn the light off active only during the night
ready light			advanced automatic light control
not used			input only, used for custom functions

Ready light

advanced automatic light control

Ready light is an advanced lighting system, based on motion and door sensors. It is best suited for closed spaces that residents don't occupy permanently.

Features:
- instant on as soon as door begins to open
- never turn off while somebody is inside
- quickly turns off when everybody is out

enable ready light — ✓ room enable

room has a natural light — ✓ only by night

occupancy status

timer

⊗ 293

motion sensor
door sensor

Input setup

Sensors are connected to spare inputs of light controller. Input must be configured to ready light mode.

Sensor placement

For a best result, sensor must be activated just after person closes the door.

Short timeout

Time from closing the door to light off. If time is too short, light may turn off after entering the room.

Long timeout

Time from leaving the room to light off, without closing the door.

light and sensor position —

2
light output

2
motion sensor

3
door sensor

short and long timeout —

10
short timeout

300
long timeout
Patent rights granted 2016-04-29 by patent office Slovenia, number 24867, class G06F 9/00.

How it works

When door begins to open, reed sensor is activated and the light turns on. When a person enters the room and closes the door, PIR activation means person is surely in the room. As long as door is closed, light will stay on. When person leaves room and closes door, system will wait for a short time, then turn the light off. If the door is left open, long timeout is active. If the PIR sensor is not activated during that time, light switches off.

Evo light

automatic transition to warm evening lights

Evo light is a half-automatic system for controlling light temperature. It uses RGB dimmer in white temperature mode. Brightness is controlled by user, hue and saturation are controlled by the system.

During the selected period, lights are going from a cool white to warm white, perfectly matching our natural daily cycle.

System can be combined with smart lights. In that case, operation is fully automatic, smart lights control brightness, and evo light control light temperature.

brightness ———————————————————————————— controlled manually

temperature ————————————————————————————

saturation ———————————————————————————— controlled by evo light
Term evo is a short for 'evolution'. During the most of our evolutionary past, our ancestors were using no artifical lighting, so daily rhythm was synchronized by sunlight. Evo light is an attempt to mimic that natural conditions.

Operation

sunrise   start hour

cold white
temperature
warm white

12   time
To configure evo light, first experimentally find the best light for early and late evening. Start hour and transition time should be configured so the warm light is reached at least one hour before bedtime.

When dimmer is switched back to RGB mode, evo light will automatically stop. Enabling again, it will catch on correctly, recalculating the new parameters.

Note: evo light setup is located on RGB page.

Heating and cooling
general features of heating/cooling system

Heating/cooling

Energy demand

configurable delay

allow termostat to start boiler
Up to five regulation zones are supported, each with their own thermostat. Generally, energy comes from boiler for heating and chiller for cooling, but other combinations are possible.

Thermostat

| TH-1M-IQ | TH-1T-IQ | TH-2-IQ | TH-3-IQ |

Actuator

| hot water radiator | electric radiator | electric fan heater | floor heating | air condition | fan-coil convector |
| direct | | external 16A relay | | | fan coil actuator |
System is versatile enough to handle most actuator options. Hot water valve is connected directly, others require either external power relay, or fan coil actuator. Different actuator types can be mixed.

Examples

air condition heating and cooling

radiator heating, air condition cooling

fan coil heating and cooling

electric heating

Timetable
weekly event scheduler

timetable 0

timetable 1
timetable 2

Each timetable can directly control an output or apply a selected scene.

Selected part is a period when heating system is active. Each rectangle represents a half hour. Tables are fully independent of each other. To set multiple fields, hold left button and drag mouse.

on

off
Each block create on and off event.

timetable
output

user command
When timetable controls an output, manual override is possible at any time, timetable will catch on with the next transition.

timetable   scene   managed socket
Timetable can be used to control mostly anything. Use a managed socket to create a time plan for your devices.

Low light goes up and down
once a day.

Automation
execute tasks automatically

Coming home
Let your house show how happy it is when you come back home. When phone connects to your wi-fi network, lights and heating will turn on automatically.

Default setpoint
When active, any setpoint adjustment is valid for about half hour, then it returns to the temperature defined in automation setup.

Leaving home
When you leave the house, smartphone disconnects from home wi-fi network, a few minutes later system will turn lights and heating off.

Bio offset
Following your natural biological rhythm (chronotype), let the house be a little warmer (or cooler) at the specified time of the day.

Smart lights
In the evening hours, when sunlight goes down, automatically set evening scene, turn on the lights and lower blinds. Works only when tenants are at home.

Connect charger
Do you charge your phone every day before going to bed? Use that action to automatically turn lights and heating off.

Random lights
When nobody is at home, discourage snooping with a simple deception: turn lights on and off to leave impression that house is not empty.

Disconnect charger
Phone is charged until morning, right? When disconnecting the charger, automatically turn lights and heating on.

Comfort wake up
System will turn thermostat on a predefined number of minutes before smartphone rings, whenever you set the alarm.

Call notification
When you receive a call, selected light will turn on and off a couple of times, to bring the attention when phone is away or silenced.

Sunny wake up
Wake up naturally, by gradually lifting blinds and let the sunlight wake you up, a predefined number of minutes before smartphone alarm.

Text notification
When you receive a text message, selected light will turn on and off a couple of times, to bring the attention when phone is away or silenced.

The most frequent question about home automation is - how to turn the damn thing off. However, regardless the inglorious reputation of smart machines, we strongly believe HIQ will gradually grow up into your daily routine. Events are generated automatically, you are in charge to assign actions according to your preferences.
Coming home
Use presence signal to set the scene and turn the heating on.

Leaving home
Use presence signal to turn the lights and heating off.

Smart lights

Automatic lights with an optional slope control, synchronized with the low light signal. Smart lights are also dependent on presence signal.

Random lights

Turn the lights on and off to leave the impression that house is not empty, to discourage burglars.

Comfort wake up

Turn the heating on a few minutes before the alarm clock.

Default setpoint
When setpoint is adjusted manually, one hour later return it to the predefined value.

Sunny wake up

Lift the blinds up a few minutes before the alarm clock.

Bio offset

A minute temperature correction depending on time of the day. Adjustable up or down.

Alarm

security at no additional cost

| OFF	alarm inactive
ARMING	alarm turned on and will be armed when time expires (default 30s)
ARMED	alarm ready, no intrusion
ACTIVATING	sensor activated, alarm has to be turned off before delay time expires (default 30s)
ACTIVE	burglary, siren output active
EXPIRED	delay time expired, siren is turned off (default 120s)

Alarm on/off

- longpress on a selected wall switch
- smartphone using HIQ Commander
- smartphone by connecting to wi-fi (Android only)
- PC with HIQ Configurator
- PC with HIQ Configurator and 4-digit code
- automatically with presence signal

On/off indicator

- small light connected to an output
- blinking of a selected light
- smartphone with HIQ Commander
- PC with HIQ Configurator

Input setup is a page in HIQ Configurator, used to configure how
an input affects it's related output. Presence setup is a part of
Automation, used to configure what will activate the presence
signal, and what will be activated by the presence signal.
Location is a place where device is expected to be installed.
Energy

electricity measurement

Energy monitoring is the first step to efficient energy usage. Once knowing how much energy something is using, one can make a rational strategy for saving.

SDM-120C power meter
CAD-232-A2 converter

Energy consumption in last 30 days [kWh]

Bargraph for last 30 days is a quick way to check for an excess consumption.

Energy by output

Power count - a number how many times the output is turned on.

Working hours - total number of hours the output spent in on state.

Nominal power - output power configured by user. It can be measured by resetable power meter, or read from the label.

Current power - output power at the current moment.

Energy today - total energy used from last midnight, expressed in Watt-hours.

Energy total - total energy consumed by the specific output.

How to measure the amount of electricity something is using

1. Turn the output off.
2. Reset relative power.
3. Turn the output on.

A few seconds later, measured relative power is displayed. If the reading is not stable, temporary turn off any load which may consume variable amount of power.

Measured rating may be used to set the nominal power on 'By output' page.

Customization

get the maximum out of your system

The goal of customization is to add functionality related to some specific needs. HIQ system is flexible and open for all kinds of modifications. This page will give a short overview how to start with modifications.

Customization is for the one who wants to get the maximum out of the system. It requires a basic programming skills. Programming language is «structured text», a kind of simplified Pascal. Development environment (editor, compiler, on-line monitor) is called CyPro, and it is free to download from the company web site.

standard HIQ system

custom program

custom devices

Modify HIQ program
- load program source directly from controller
- put your code into custom_algo module
- send modified program back to controller

Combine HIQ and non-HIQ modules
- all HIQ modules are fully IEX compatible
- delete unused HIQ modules from hardware setup
- add your own selection of IEX modules
- modify program according to your needs

HIQ Commander for non-HIQ applications
- allocate variables for autodetection manually
- use allocated variables in your cybro application
- check Cypro example HiqCommanderDemo

Non-standard HIQ configuration
- custom selection of modules, e.g. 10x LC-10-IQ
- hardware setup, manually add new modules
- adjust program and mini scada up to your needs

Modify HIQ Mini View for your house
- no special tools are needed
- configuration consist of one text file and images
- use Notepad to change configuration file
- use an image editor to create custom graphics

Connect HIQ systems together
- create system as big as you like
- use sockets as a link between controllers
- implement all kinds of commands

Example

Task: add counter how many times light is switched on

1. CyPro

- allocate variable lc00_qx00_count, make it retentive
- add the following lines of code into program
- send program to controller

2. Mini scada

- open CyBroMiniView.xml in text editor (Notepad)
- add object to xml configuration, inside the first page
- use scada (ctrl-E) to move object to the right place

```
if fp(lc00_qx00) then
  lc00_qx00_count:=lc00_qx00_count+1;
end_if;
```

```
<object>
  <type>led</type>
  <var>c1000.lc00_qx00_counter</var>
  <digits>4</digits>
  <decimals>0</decimals>
  <zeroblanking>1</zeroblanking>
  <sign>0</sign>
  <ledcolor>$FF0000</ledcolor>
  <height>42</height>
  <x>100</x>
  <y>100</y>
</object>
```
HIQ Configurator

Input mode defines how input affect the output. Basic
functions are handled internally by light controller, night
mode and ready light are handled with home controller.
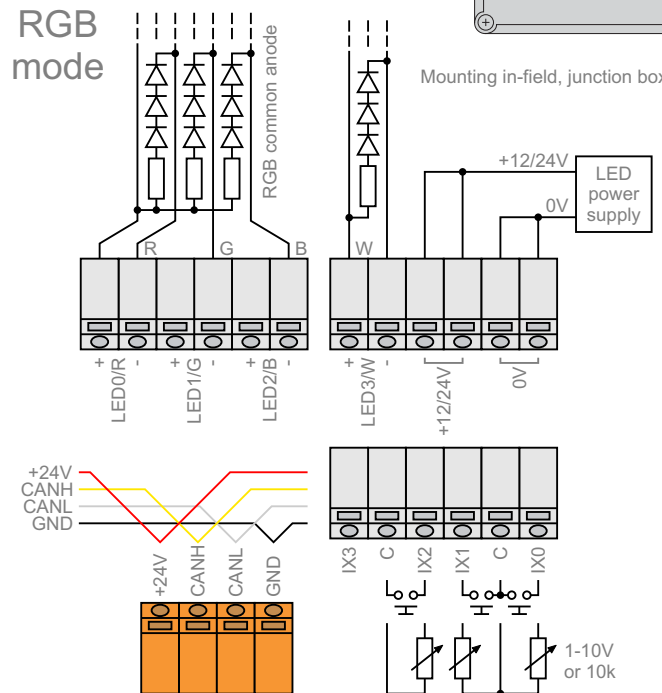

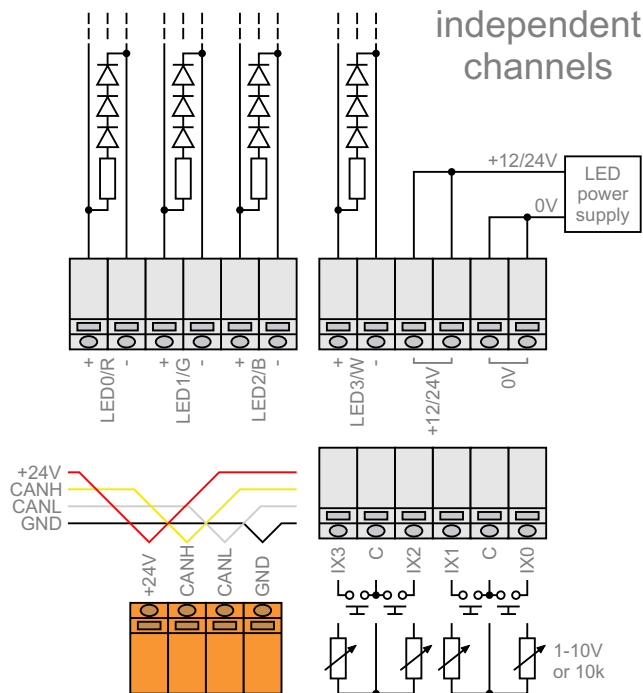

IEX-2 © HIQ ▣ C€

Output power per relay:
- incadescent / halogen 230V   800W
- halogen 12V with transformer   400W
- fluorescent with electronic ballast 400W
- parallel compensated fluo lamps   250W/30uF
- LED with transformer or compact   400W
Total output power (all relays):   4000W
Maximum input cable length: 50m
Power supply: 24V/120mA
Ingress protection: IP20
Operating temperature: 0..45°C
Storage temperature: -20..75°C
Relative humidity: 0..95% n/c
Dimensions: 106x108x58mm
Weight: 250g
Standards: EN 61000-6-2

Features

RGB mode
hue, saturation, brightness instead of individual RGB

white temperature mode
adjust hue in range from warm white to cold white

button or potentiometer input:
- autodetect input mode
- mixed controlls possible
- potentiometer auto-range

S-shaped on/off curve:
- soft start and landing
- fast and slow mode
- reduce electric noise
exponential output curve:
- natural feeling
- lowest level is 0.025%
- smooth transition
500Hz

high frequency PWM:
- no flickering
- avoid headache
- reduce eye-strain

output protection:
- overcurrent
- overvoltage
- undervoltage
- watch-dog

power outage:
<10min - lights come back
>10min - lights will stay off

LD-D8-IQ DALI dimmer

8-channel dimmer for DALI ballasts

Features

8x — control 8 independent groups

64x — drive up to 64 ballasts

24V — 200mA — internal DALI current source, no additional power needed

DALI+ DALI-

IW0   C0   IW1

T0   T1

Mounting:
DIN rail 2M

36

Operation

T0

short press: on/off   long press: 0..100%

T1

short press: on/off   long press: 0..100%

Groups 3 to 8 doesn't have physical input, so they can't be controlled directly, only as a scene or with a phone.

Ballast configuration

group 1   group 5
group 2   group 6
group 3   group 7
group 4   group 8

Organize your ballasts into groups with address 1 to 8. DALI dimmer master can't control individual ballasts.

Output options

incandescent lights

fluorescent

compact fluorescent

LED lights of any kind

IEX-2 © HIQ ▣ C€

Digital inputs: internal pull-up 12V, 2mA
DALI output: 64 ballasts/200mA max.
Power supply: 24V/120mA
Galvanic separation: none (DALI must be SELV)
Ingress protection: IP20
Operating temperature: 0..45°C
Storage temperature: -20..75°C
Relative humidity: 0..95% n/c
Dimensions: 36x108x58mm
Weight: 80g
Standards: EN 61000-6-2
                             EN 61000-6-3

# BC-5-IQ blinds controller

5-channel blinds position controller

Mounting: 35mm DIN rail 6M

106
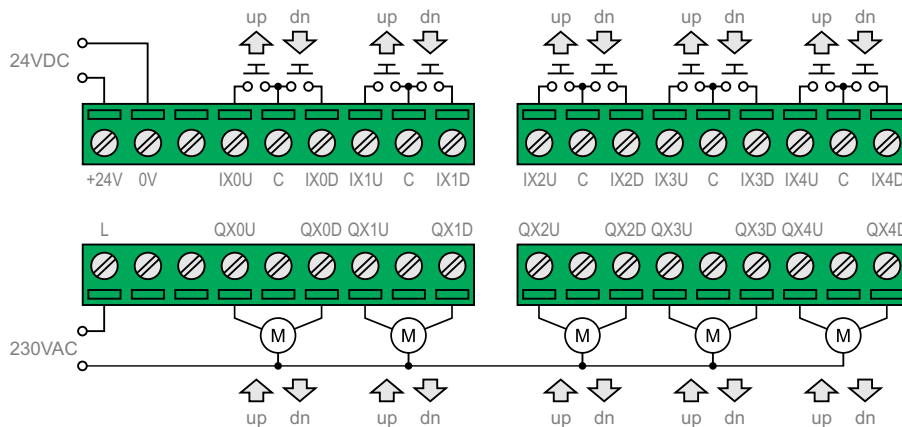

Features

short press: move up/down

short press while moving: stop at the position

long press: stop after released

75%
short press: move to intermediate position

automatic position related to scene

up and down buton

automatic correction
at boundary position

Travel time adjustment:

1. Adjust top and bottom limit switch.
2. Use stopwatch to measure travel time in both directions.
3. Mark a position on the window (e.g. 75%), then move blinds a few times up and down, without reaching the top or bottom. If the desired position shifts up, increase down time (or decrease up time) and check again. Repeat procedure until the positioning is precise enough.

GND					C2	

RHKF-U   **HC-IQ**

Motion sensor is mounted above or lateral to room entrance. People entering the room must intersect sensor beams. At the moment when closing the door, person should be in the area of maximum sensitivity.
Door sensor is mounted on the knob side, usually about 20cm from the top. Magnet goes into the door, contact goes into the doorpost.

Sensors are connected to spare LC-10-IQ inputs. Input type must be configured as sensor input.

Light sensor is mounted on top of an outside looking window. Best option is west or south side.

For a room with more then one entrance, door sensors are connected in series (sensor is closed when door is closed), and motion sensors are connected in parallel.

Wiring

Switchboard and field modules

switchboard	field modules
100m max.	
Power supply must be connected to the first (leftmost) device. When devices are connected, autoaddress procedure must be started using HIQ Configurator.
Devices inside switchboard are addressed sequentially, from left to right. Devices outside of switchboard (field modules) are addressed in order of ascending serial numbers - lowest serial number gets the first address, second lowest the second, and so on.

Inside the switchboard, bus is connected with 4x flat cable and RJ9 connectors. Outside the switchboard, bus is connected with a unshielded twisted-pair cable and orange push-wire terminals.
Maximum bus length is 100 meters. Up to that length, bus can be connected with no special rules, branching is allowed. Longer bus (up to 300m) is possible, but cable must be connected in line (no branches/trunks), and last device must be terminated with a 120ohm resistor between CANL and CANH.
Bus wiring

1. Take one ingoing and one outgoing wire together, and remove insulation for about 10-12mm.

10-12mm
2. Crimp wires together into a ferrule.

3. Wrap wires together for a few centimeters.

50mm

4. Push ferrules into clamps.

Recommended bus cable
